REVERSE OSMOSIS PLANT BUILT IN CONTAINER

WATER TREATMENT TECHNOLOGIES

Our Company produces **special plants for the production of potable water coming from rivers, sea and wells, and also for wastewater treatment.**

Our plants may be fixed or movable, addressed to little communities, towns and cities.

Thanks to our movable plants we are able to **provide for the lack of water due to natural emergencies** (earthquakes, snowstorms, hurricanes), while through our fixed plants we can **produce water of great quality and purity**, since we use advanced technologies such as **ultrafiltration and reverse osmosis**.

Wastewater treatment plants are used for both civil and industrial discharges, offering the possibility to flow the purified water into superficial waters and fields, according to the international standard rules.

It is possible to use advanced technologies such as ultrafiltration for the treatment of industrial discharges in order to recover important raw materials, or treat oil emulsions.
